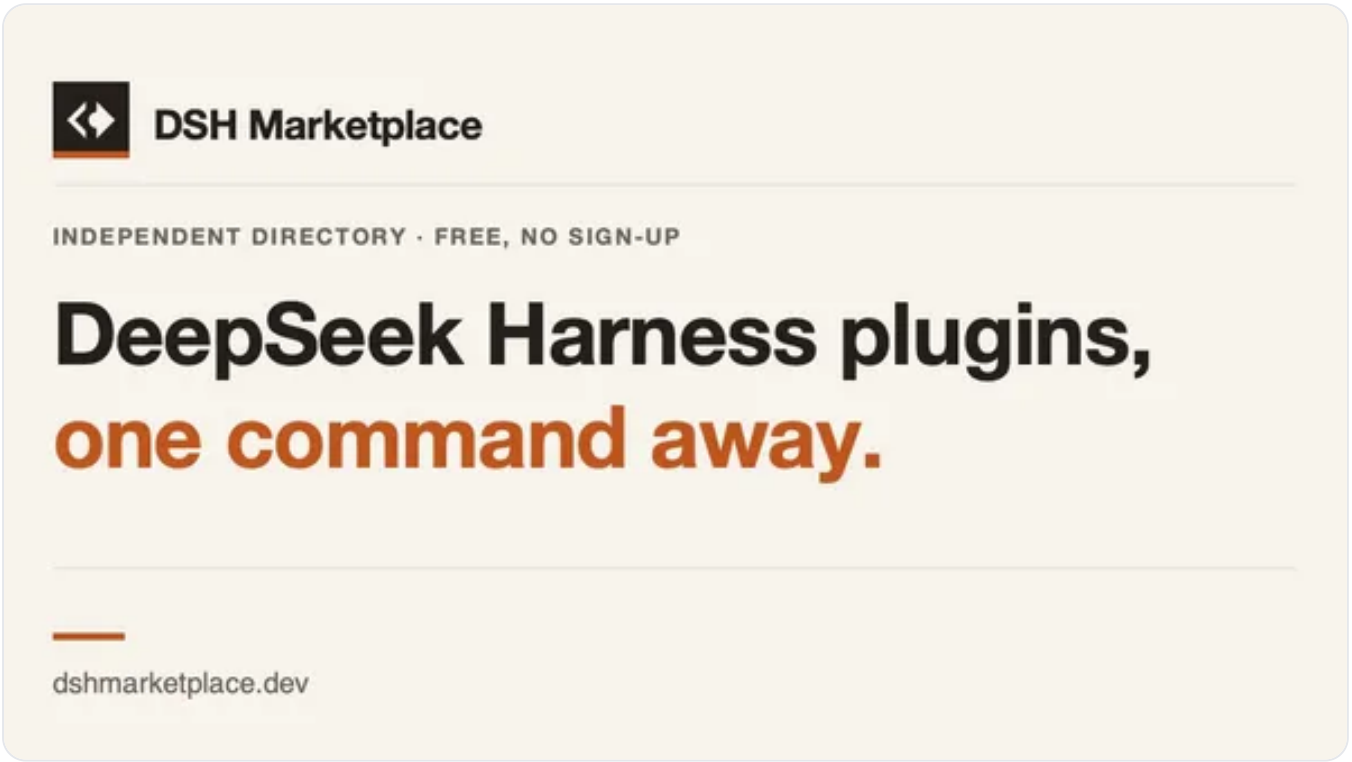
DeepSeek Harness Plugins

A free, no-sign-up directory of DeepSeek Harness plugins with install commands, repos, licences, and reach details.



About

DeepSeek Harness Plugins is a DeepSeek Harness plugin directory that helps you check install commands, source repos, licences, and reach before you try anything. It indexes 5,077 community plugins and shows whether each one really installs in a clean profile, making it easier to compare agent extensions without digging through scattered repos. The site is free, requires no sign-up, and includes live detail pages for selected listings.

What is DeepSeek Harness Plugins

DeepSeek Harness Plugins is an independent catalogue for DeepSeek Harness

topic, then presents them as browseable listings with practical installation and repository details.

The site focuses on the facts people usually need before trying an agent plugin:

- install command, when one is available
- source repository and licence
- what the plugin can reach or control
- whether a real install succeeded in a clean profile
- last-push timing and star count for repository context

At the time shown on the site, the directory had 5,077 indexed plugins, 14 categories, and 90 live detail pages. It also exposes an API and a submit-a-plugin flow, which suggests the catalogue is meant to stay current as the community grows.

Key features

DeepSeek Harness Plugins is built around comparison, not just discovery. Each card is designed to help you decide quickly whether a plugin is worth testing.

- **Install-state checking**: the site says whether a plugin actually installs, based on a clean-profile run.
- **Repository metadata**: listings surface the GitHub source, licence, and repo-level signals such as stars and last push date.
- **Capability summaries**: cards explain what a plugin can access or reach, which is useful for agent tooling and safety review.
- **Searchable catalogue**: you can browse the full set of 5,077 entries rather than relying on topic pages alone.
- **AI-generated review notes**: some entries include an AI take, a short verdict, and a warning section. The site labels these as generated by grok-4.6 and as a starting point, not a final authority.
- **No account wall**: the site is free and does not ask for sign-up.

This makes it closer to a plugin registry or extension directory than a general software marketplace.

How to use it

- Open the catalogue and search for the DeepSeek Harness plugin name, repo, or topic you care about.
- Open a listing to read the install command, source repo, licence, and capability summary.
- Check the install result before you copy anything into your environment.
- Read the last-push date and star count as context, not as proof of quality or maintenance.
- If a listing includes an AI review, use it as a quick triage note and verify the underlying repository yourself.
- Use the API or submit flow if you want to integrate the directory into your own workflow or add a plugin.

Because the site emphasizes clean-profile install results, it is especially useful when you want to compare multiple harness plugins without manually cloning each repository.

Who it is for

DeepSeek Harness Plugins is a good fit for people working with DeepSeek Harness and related agent workflows.

- **Agent builders** who want memory, context, UI, or workflow plugins
- **Developers** evaluating whether a repository is installable before testing it
- **People auditing risk** who need to know what a plugin can reach, not just what it claims to do
- **Users browsing the ecosystem** who want a centralized view of community entries
- **Teams using DeepSeek Harness in Web UI setups** that need plugins, skins, or UI add-ons

The directory is also helpful if you prefer a quick side-by-side review of plugin metadata rather than reading many GitHub READMEs.

What to know before you use it

The catalogue covers community-indexed plugins, so coverage depends on what the registry and GitHub topic expose.

Some entries do **not** have a one-line install because they live inside larger repositories or do not publish an npm package.

AI review notes are explicitly described as generated starting points, so they can be wrong or incomplete.

The site says install outcomes come from a real run in a clean profile, but it also warns that some plugins may execute shell commands and may not have been sandbox-tested.

If you need authoritative security, licence, or maintenance details, go back to the source repository and its licence file.

If a plugin affects sensitive behavior such as shell execution, URI handling, memory persistence, or UI automation, verify it in your own controlled environment before trusting it.

For browsing the DeepSeek Harness plugin ecosystem quickly, this directory gives you a useful first pass. For final approval, rely on the official repository and your own review. DeepSeek Harness Plugins is best used as a discovery and triage layer before you install a plugin.

FAQ

Is DeepSeek Harness Plugins free to use?

Does it show whether a plugin actually installs?

How many plugins are indexed in the directory?

Does the directory show whether a plugin really installs?
